.....the solution is clear

Oil Rig Installation

Humidity Solutions have supplied and installed four resistive steam humidifiers to the Caspian Sea oil rigs off Azerbaijan. These humidifiers are provided to sever the accommodation blocks of the rigs which are home to the oil workers for up to a month at a time. Despite being surrounded by water the cooler air temperatures and constant air conditioning reduces the moisture content in the air to an uncomfortably low level without the assistance of these humidifiers.

Installation was carried out by Humidity Solutions engineers after undergoing the off shore safety course in Aberdeen which included being strapped to a replica helicopter as it is plunged into icy water and rolled over to simulate a ditching in the sea.

The UR Resistive steam humidifiers were selected for the project as being the best equipment for the job and offering the best value for money. The humidifiers run off desalination water supply and the insulated steam cylinder provides an energy saving over other resistive humidifiers. Excellent humidity control provided by the humidifiers built in controller combined with the humidifiers standard two year warranty made the UR the obvious choice for this critical application.
